**NASA Headquarters**

## Questions in Using PRA in Decision Making

---

- Are numerical risk acceptance criteria necessary, or even desirable, for using PRA in decision making?
- Should PRA results be transformed to categories or be fuzzified to reflect their uncertainties?
- Should PRA results only be used as supplemental, information in decision making?
- What is needed to more formally incorporate PRA in decision making?
- Can PRA uncertainties be more formally, yet practically, incorporated in decision making?
- How can relative results be used in PRA, other than giving a sense of what is important?
- How should PRA results be factored with other information in decision making?
